Emergent leaves
Feather-like leaves
CONTROL AND MANAGEMENT

Place double stop nets downstream before starting control. These will catch any escaping fragments.
Maunal removal is recommended for parrot’s feather.
Use a hand saw to cut manageable sections, and forks/rakes to pull the biomass onto the bank.
CONTROL AND MANAGEMENT

Check for fragments that have snapped off.
CONTROL AND MANAGEMENT

Pile up the biomass
Here, the biomass was transported elsewhere to decompose away from the public.
